## 1

## CHAPTER

## रसायन विज्ञान (Chemistry)

## Physical Chemistry (भौतिक रसायन)

Mole Concept | Atomic Structure | Chemical Bonding |  
States of Matter

## मोल संकल्पना | परमाणु संरचना | रासायनिक आबंधन | पदार्थ की अवस्थाएँ

## भाग 1: मोल अवधारणा (Mole Concept)

## 1.1 मोल की परिभाषा

1 Mole = किसी पदार्थ की वह मात्रा जिसमें उतने ही कण (atoms/molecules/ions) हों जितने 12g Carbon-12 में atoms होते हैं।

**1 Mole =  $6.022 \times 10^{23}$  particles** [Avogadro's Number ( $N_a$ ) — खोजकर्ता: Amedeo Avogadro]

Concept	Formula	Unit	Example
Mole (n)	$n = W/M$	mol	18g water = 1 mol   36g = 2 mol
Molar Mass (M)	$M = W/n$	g/mol	H <sub>2</sub> O = 18 g/mol   NaCl = 58.5 g/mol
Number of particles	$N = n \times N_a$	—	1 mol H <sub>2</sub> O = $6.022 \times 10^{23}$ molecules
Molar volume (STP)	$V = n \times 22.4 \text{ L}$	L	1 mol any gas at STP = 22.4 L
Equivalent weight	$E = M/n\text{-factor}$	g/eq	n-factor = valency/charge change

## 1.2 Stoichiometry और Concentration

Concentration Unit	Formula	Definition	Example
Molarity (M)	$M = \frac{\text{moles}}{\text{L solution}}$	Moles of solute per litre of solution	1M NaCl = 58.5g NaCl in 1L
Molality (m)	$m = \frac{\text{moles}}{\text{kg solvent}}$	Moles of solute per kg of solvent	1m NaCl = 58.5g NaCl in 1kg water
Mole Fraction ( $\chi$ )	$\chi = \frac{n_a}{n_a + n_b}$	Ratio of moles of component to total	$\chi_{\text{water}}$ in 10% solution $\approx 0.93$
Normality (N)	$N = \frac{\text{equivalents}}{\text{L}}$	Eq. of solute per litre solution	1N H <sub>2</sub> SO <sub>4</sub> = 49g in 1L
% w/v	$\frac{\text{g solute}}{100\text{mL solution}}$	Grams per 100 mL	5% glucose = 5g/100mL (Clinical use)
ppm	mg/L or mg/kg	Parts per million	Drinking water standards

**Molarity vs Molality:** Molarity: Solution volume में change होता है with temperature | Molality: Solvent mass — temperature independent | Medical solutions mostly in Molarity (M) | IV fluids: 0.9% NaCl = 154 mEq/L = 0.154 M

### 1.3 Limiting Reagent और % Yield

- ✓ Limiting Reagent (अवरोधक अभिकारक): वह reactant जो पहले समाप्त हो — Product की मात्रा इसी से निर्धारित
- ✓ % Yield = (Actual yield / Theoretical yield) × 100
- ✓ Atom Economy = (Molar mass of desired product / Sum of molar masses of all reactants) × 100

## भाग 2: परमाणु संरचना (Atomic Structure)

### 2.1 परमाणु के मूल कण

Particle	Symbol	Charge	Mass (amu)	Discoverer	Year
Proton	p	+ 1.6×10 <sup>-19</sup> C	1.0073	E. Rutherford	1919
Neutron	n	Neutral (0)	1.0087	James Chadwick	1932
Electron	e <sup>-</sup>	- 1.6×10 <sup>-19</sup> C	0.000549 (1/1836)	J.J. Thomson	1897
Positron	e <sup>+</sup>	+ 1.6×10 <sup>-19</sup> C	Same as e <sup>-</sup>	Carl Anderson	1932

### 2.2 परमाणु मॉडल (Atomic Models)

Model	Scientist	Year	Key Features	Limitation
Plum Pudding	J.J. Thomson	1904	Electrons embedded in positive sphere	Cannot explain α-scattering
Nuclear	Rutherford	1911	Small dense +ve nucleus   Electrons orbit	Unstable (electron radiation)
Bohr's Model	Niels Bohr	1913	Fixed orbits (shells)   Quantized energy   No emission in orbit	Only for H-like atoms
Wave Mechanical	de Broglie + Schrödinger	1926	Orbitals (probability clouds)   $\psi^2$ = probability	Current accepted model

### 2.3 Quantum Numbers (क्वान्टम संख्याएँ)

Quantum Number	Symbol	Values	Determines
Principal (मुख्य)	n	1, 2, 3, 4... (K,L,M,N)	Energy of shell   Size   Max electrons = 2n <sup>2</sup>
Azimuthal/Angular (दिगंशीय)	l	0 to (n-1) (s,p,d,f)	Shape of orbital   Subshell
Magnetic (चुम्बकीय)	m <sub>l</sub>	-l to +l	Orientation in space   Number of orbitals
Spin (चक्रण)	m <sub>s</sub>	+1/2 or -1/2	Electron spin direction

Subshell	l	$m_l$ values	Orbitals	Max electrons
s	0	0	1	2
p	1	-1, 0, +1	3	6
d	2	-2, -1, 0, +1, +2	5	10
f	3	-3, -2, -1, 0, +1, +2, +3	7	14

## 2.4 Electronic Configuration — Rules

- ✓ Aufbau Principle: Electrons fill lowest energy orbital first — 1s, 2s, 2p, 3s, 3p, 4s, 3d, 4p...
- ✓ Pauli Exclusion Principle: एक orbital में अधिकतम 2 electrons — opposite spins
- ✓ Hund's Rule: एक subshell में पहले सभी orbitals में 1-1 electron (same spin), फिर pairing

**Energy Order:**  $1s < 2s < 2p < 3s < 3p < 4s < 3d < 4p < 5s < 4d < 5p$  | याद करें: (n+1) rule — Lower (n+1) fills first | Same (n+1) → Lower n first

Element	Z	Configuration	Notes
Hydrogen (H)	1	$1s^1$	1 electron
Carbon (C)	6	$1s^2 2s^2 2p^2$	6 electrons — 2 unpaired (2 bonds possible)
Nitrogen (N)	7	$1s^2 2s^2 2p^3$	3 unpaired (Hund's) — 3 bonds
Oxygen (O)	8	$1s^2 2s^2 2p^4$	2 unpaired — 2 bonds + 2 lone pairs
Sodium (Na)	11	$[\text{Ne}] 3s^1$	1 valence electron — alkali metal
Chlorine (Cl)	17	$[\text{Ne}] 3s^2 3p^5$	7 valence electrons — 1 electron short
Iron (Fe)	26	$[\text{Ar}] 3d^6 4s^2$	Exception — 3d partially filled
Copper (Cu)	29	$[\text{Ar}] 3d^{10} 4s^1$	Exception — Extra stability of full 3d
Chromium (Cr)	24	$[\text{Ar}] 3d^5 4s^1$	Exception — Extra stability of half-filled 3d

## भाग 3: रासायनिक बन्धन (Chemical Bonding)

### 3.1 Types of Chemical Bonds

Bond Type	Between	Example	Properties
Ionic Bond	Metal + Non-metal   $e^-$ transfer	NaCl, MgO, $\text{CaCl}_2$	High MP/BP, Conducts electricity when molten/dissolved, Brittle, Crystalline
Covalent Bond	Non-metal + Non-metal   $e^-$ sharing	$\text{H}_2\text{O}$ , $\text{CO}_2$ , $\text{CH}_4$ , HCl	Variable MP/BP, Poor electrical conductors (mostly), Directional
Coordinate/Dative	Both electrons from one atom	$\text{NH}_4^+$ , $\text{H}_3\text{O}^+$ , $[\text{Fe}(\text{CN})_6]^{4-}$	Like covalent after formation
Metallic Bond	Metal atoms   Delocalized $e^-$ sea	Cu, Fe, Na metals	Conducts electricity, Malleable, Ductile, Lustre

Hydrogen Bond	H bonded to N, O, F + lone pair	H <sub>2</sub> O, HF, DNA, Proteins	Weak but important   Responsible for water properties
Van der Waals	Non-polar molecules	Noble gases, CH <sub>4</sub> , hydrocarbons	Weakest   London dispersion forces

### 3.2 VSEPR Theory (Valence Shell Electron Pair Repulsion)

- ✓ VSEPR Theory: Electron pairs (bond pairs + lone pairs) repel each other और जितनी हो सके दूर रहती हैं — Molecular shape निर्धारित होती है।

Molecule	Bond Pairs	Lone Pairs	Shape	Bond Angle	Example
2 BP, 0 LP	2	0	Linear	180°	BeCl <sub>2</sub> , CO <sub>2</sub> , HCN
3 BP, 0 LP	3	0	Trigonal Planar	120°	BF <sub>3</sub> , SO <sub>3</sub> , AlCl <sub>3</sub>
2 BP, 1 LP	2	1	Bent/Angular	< 120° (≈119°)	SO <sub>2</sub> , SnCl <sub>2</sub>
4 BP, 0 LP	4	0	Tetrahedral	109.5°	CH <sub>4</sub> , CCl <sub>4</sub> , NH <sub>4</sub> <sup>+</sup>
3 BP, 1 LP	3	1	Trigonal Pyramidal	107°	NH <sub>3</sub> , PCl <sub>3</sub>
2 BP, 2 LP	2	2	Bent/V-shape	104.5°	H <sub>2</sub> O, H <sub>2</sub> S
5 BP, 0 LP	5	0	Trigonal Bipyramidal	90° + 120°	PCl <sub>5</sub>
6 BP, 0 LP	6	0	Octahedral	90°	SF <sub>6</sub> , [Fe(CN) <sub>6</sub> ] <sup>3-</sup>

**Lone Pair Effect:** Lone pairs more repulsive than bond pairs | NH<sub>3</sub>: 109.5° → 107° (1 lone pair) | H<sub>2</sub>O: 109.5° → 104.5° (2 lone pairs) | Lone pairs occupy equatorial position in Trigonal bipyramidal

### 3.3 Hybridization (संकरण)

Hybridization	Geometry	Bond Angle	Example	Notes
sp	Linear	180°	BeCl <sub>2</sub> , CO <sub>2</sub> , HC≡CH, HCN	2 hybrid orbitals   Triple bond
sp <sup>2</sup>	Trigonal Planar	120°	BF <sub>3</sub> , C <sub>2</sub> H <sub>4</sub> (Ethylene), SO <sub>3</sub>	3 hybrid   Double bond   π bond
sp <sup>3</sup>	Tetrahedral	109.5°	CH <sub>4</sub> , NH <sub>3</sub> , H <sub>2</sub> O, C <sub>2</sub> H <sub>6</sub> (Ethane)	4 hybrid   Single bonds only
sp <sup>3</sup> d	Trigonal Bipyramidal	90°+120°	PCl <sub>5</sub> , SF <sub>4</sub>	5 hybrid
sp <sup>3</sup> d <sup>2</sup>	Octahedral	90°	SF <sub>6</sub> , [Co(NH <sub>3</sub> ) <sub>6</sub> ] <sup>3+</sup>	6 hybrid
dsp <sup>2</sup>	Square Planar	90°	[Ni(CN) <sub>4</sub> ] <sup>2-</sup> , [PtCl <sub>4</sub> ] <sup>2-</sup>	Inner d-orbital   Strong field ligands

### 3.4 Molecular Orbital Theory (MOT)

- ✓ MOT में Atomic orbitals combine करके Molecular orbitals बनाते हैं
- ✓ Bonding MO (BMO): Energy lower than AO — Electrons यहाँ = Stable bond
- ✓ Anti-bonding MO (ABMO): Energy higher than AO — Electrons यहाँ = Weakens bond (marked \*)

**Bond Order** =  $\frac{1}{2} \times (\text{Bonding electrons} - \text{Antibonding electrons})$  [Higher Bond Order = Stronger + Shorter bond]

Molecule	Bond Order	Magnetic Property	Stability
H <sub>2</sub>	1	Diamagnetic	Stable
He <sub>2</sub>	0	—	Does not exist
O <sub>2</sub>	2	Paramagnetic (2 unpaired)	Stable   MOT explains paramagnetism
N <sub>2</sub>	3	Diamagnetic	Very stable (Triple bond)
O <sub>2</sub> <sup>+</sup>	2.5	Paramagnetic	More stable than O <sub>2</sub>
O <sub>2</sub> <sup>-</sup> (Superoxide)	1.5	Paramagnetic	Less stable

### भाग 4: पदार्थ की अवस्थाएँ (States of Matter)

#### 4.1 Gas Laws

Law	Relation	Condition	Formula
Boyle's Law	$P \propto 1/V$	Constant T, n	$P_1V_1 = P_2V_2$
Charles' Law	$V \propto T$	Constant P, n	$V_1/T_1 = V_2/T_2$
Gay-Lussac's	$P \propto T$	Constant V, n	$P_1/T_1 = P_2/T_2$
Avogadro's	$V \propto n$	Constant P, T	Equal volumes = Equal moles
Dalton's Partial P	$P_{\text{total}} = \sum P_i$	Gas mixture	$P_1 = \chi_1 \times P_{\text{total}}$

**Ideal Gas:**  $PV = nRT$  [R = 8.314 J/mol·K = 0.0821 L·atm/mol·K]

**Van der Waals (Real Gas):**  $(P + an^2/V^2)(V - nb) = nRT$  [a = intermolecular attraction | b = volume of molecules]

#### 4.2 Liquid State — Surface Tension, Viscosity

Property	Definition	Temperature effect	Example / Application
Surface Tension ( $\gamma$ )	Force per unit length at surface — due to cohesive forces	Decreases with T↑	Water droplets, Soap bubbles, Lung surfactant

Viscosity ( $\eta$ )	Resistance to flow — Internal friction	Decreases with $T \uparrow$ (Liquids)   Increases with $T$ (Gases)	Blood viscosity (3-4 mPas) important in CVD
Vapour Pressure	Pressure of vapour above liquid at equilibrium	Increases with $T \uparrow$	Boiling when VP = Atmospheric pressure

**Blood Viscosity:** Blood viscosity = 3-4 mPa·s (water = 1 mPa·s) | High viscosity = Poor circulation risk | Haematocrit  $\uparrow \rightarrow$  Viscosity  $\uparrow$  | Anaemia  $\rightarrow$  Viscosity  $\downarrow$  | Temperature  $\uparrow \rightarrow$  Viscosity  $\downarrow$  (improved flow)

### 4.3 Solid State

Crystal Type	Particles	Forces	Properties	Examples
Ionic Crystal	Cations + Anions	Electrostatic	High MP, Brittle, Conducts when dissolved	NaCl, CaCO <sub>3</sub> , KNO <sub>3</sub>
Covalent Crystal	Atoms	Covalent bonds	Very high MP, Hard, Non-conductor	Diamond, SiO <sub>2</sub> , SiC
Metallic Crystal	Metal ions + e <sup>-</sup> sea	Metallic bonds	Conducts electricity, Malleable, Ductile, Lustrous	Fe, Cu, Na, Au
Molecular Crystal	Molecules	H-bond / VdW	Low MP, Soft, Non- conductor	Ice, Dry ice (CO <sub>2</sub> ), Naphthalene

**Bragg's Law:**  $n\lambda = 2d \cdot \sin\theta$  [X-ray diffraction — Crystal structure determination | n=integer,  $\lambda$ =wavelength, d=interplanar spacing,  $\theta$ =angle]

<b>BOOSTER POINTS — Paramedical Entrance Exam</b>
1. 1 Mole = $6.022 \times 10^{23}$ particles (Avogadro's number)   Molar mass = molecular mass in grams
2. STP: 0°C, 1 atm   1 mol gas at STP = 22.4 L   SATP: 25°C, 1 bar = 24.8 L
3. Molarity (M) = mol/L solution — Temperature dependent   Molality (m) = mol/kg solvent — Temperature independent
4. 0.9% NaCl (Normal Saline) = 9g NaCl/L = 154 mEq/L Na <sup>+</sup> = 154 mEq/L Cl <sup>-</sup> (Clinical)
5. J.J. Thomson = Electron (1897)   Rutherford = Proton + Nuclear model (1911)   Chadwick = Neutron (1932)
6. Bohr's model: $E_n = -13.6/n^2$ eV   $r_n = 0.529n^2$ Å   Only valid for H-like (1 electron) atoms

7. Aufbau: 1s,2s,2p,3s,3p,4s,3d,4p   Pauli: 2e <sup>-</sup> per orbital (opposite spin)   Hund's: Max unpaired
8. Cu=[Ar]3d <sup>10</sup> 4s <sup>1</sup> (NOT 3d <sup>9</sup> 4s <sup>2</sup> )   Cr=[Ar]3d <sup>5</sup> 4s <sup>1</sup> (NOT 3d <sup>4</sup> 4s <sup>2</sup> ) — Extra stability
9. Ionic bond: Metal+Non-metal   Covalent: Non-metal+Non-metal   Metallic: Metal+Metal
10. H-bond: H bonded to N,O,F   Responsible for water's high BP, Surface tension, DNA structure
11. sp=Linear(180°)   sp <sup>2</sup> =Trigonal Planar(120°)   sp <sup>3</sup> =Tetrahedral(109.5°)
12. H <sub>2</sub> O: sp <sup>3</sup> , 2 lone pairs → bent (104.5°)   NH <sub>3</sub> : sp <sup>3</sup> , 1 lone pair → pyramidal (107°)
13. VSEPR: Lone pair > Bond pair repulsion   Order: LP-LP > LP-BP > BP-BP
14. Bond Order = ½(BMO-ABMO)   O <sub>2</sub> : Bond Order=2, Paramagnetic   N <sub>2</sub> : Bond Order=3, Diamagnetic
15. Van der Waals equation: 'a' = intermolecular attraction   'b' = volume excluded
16. Surface tension ↓ with T↑   Blood viscosity 3-4 mPas   High Haematocrit → High viscosity
17. Crystal types: Ionic (high MP)   Covalent (hardest)   Metallic (conducts)   Molecular (low MP)
18. Diamond = Covalent crystal (Hardest natural substance)   Graphite = Layered covalent (conducts)

## ऊष्मागतिकी, साम्य, विलयन एवं विद्युत रसायन

### Thermodynamics | Equilibrium | Solutions | Electrochemistry

#### भाग 1: रासायनिक ऊष्मागतिकी (Chemical Thermodynamics)

##### 1.1 System, Surroundings और State Functions

Term	Definition	Examples
System (तंत्र)	जिसका अध्ययन किया जाए	Reaction vessel, Body cell
Open System	Mass + Energy दोनों exchange	Beaker (open), Human body
Closed System	Only energy exchange, No mass	Sealed container with gas
Isolated System	No exchange (mass or energy)	Thermos flask (ideal), Universe
State Functions	Path-independent — depend only on initial + final state	H, S, G, U, P, V, T
Process Functions	Path-dependent	Q (heat), W (work)

## 1.2 Thermodynamic Laws

Law	Statement	Equation	Significance
Zeroth Law	A = Equilib. B, B = Equilib. C $\rightarrow$ A = Equilib. C	—	Defines Temperature   Basis of thermometers
First Law	$\Delta U = Q - W$	$\Delta U = Q - P\Delta V$	Conservation of energy   Hess's law basis
Second Law	Entropy increases for spontaneous processes	$\Delta S_{\text{universe}} > 0$	Explains direction of change
Third Law	$S \rightarrow 0$ as $T \rightarrow 0$ K	$S(\text{perfect crystal at } 0\text{K}) = 0$	Absolute entropy calculation

## 1.3 Enthalpy ( $\Delta H$ ) — Heat of Reaction

$$\Delta H = H_{\text{products}} - H_{\text{reactants}} \quad [\Delta H < 0: \text{Exothermic} \mid \Delta H > 0: \text{Endothermic}]$$

Type of Enthalpy	Symbol	Definition	Example
Enthalpy of combustion	$\Delta H_c$	Complete combustion of 1 mole in $O_2$	$\Delta H_c(C) = -393.5$ kJ/mol
Enthalpy of formation	$\Delta H_f^\circ$	Formation of 1 mole from elements	$\Delta H_f^\circ(H_2O, l) = -286$ kJ/mol
Enthalpy of neutralisation	$\Delta H_n$	Neutralisation of 1 mole $H^+$ by $OH^-$	Strong acid+base: -57.1 kJ/eq
Enthalpy of fusion	$\Delta H_{\text{fus}}$	Solid $\rightarrow$ Liquid for 1 mole	Ice $\rightarrow$ Water: +6.0 kJ/mol
Enthalpy of vaporisation	$\Delta H_{\text{vap}}$	Liquid $\rightarrow$ Gas for 1 mole	Water $\rightarrow$ Steam: +44 kJ/mol at 25°C
Bond Enthalpy	—	Energy to break 1 mole of bonds	C-C: 347, C=C: 620, C $\equiv$ C: 812 kJ/mol

**Hess's Law:**  $\Delta H_{\text{reaction}} = \Delta H_{\text{products}} - \Delta H_{\text{reactants}}$  | Hess's Law:  $\Delta H$  is independent of path | Standard state: 25°C (298K), 1 bar | Born-Haber cycle uses Hess's Law for ionic compounds

## 1.4 Entropy (S) और Gibbs Free Energy (G)

$$\Delta S = Q_{\text{rev}}/T \quad [\text{Entropy change} \mid \text{Unit: J/mol}\cdot\text{K}]$$

$$\Delta G = \Delta H - T\Delta S \quad [\text{Gibbs Free Energy} \mid \Delta G < 0: \text{Spontaneous} \mid \Delta G = 0: \text{Equilibrium} \mid \Delta G > 0: \text{Non-spontaneous}]$$

$\Delta G^\circ = -RT \ln K = -nFE^\circ$  [Relationship between  $\Delta G$ , K (equilibrium), and E (cell potential)]

$\Delta H$	$\Delta S$	$\Delta G = \Delta H - T\Delta S$	Spontaneity
Negative (-)	Positive (+)	Always Negative (-)	Always spontaneous
Positive (+)	Negative (-)	Always Positive (+)	Never spontaneous
Negative (-)	Negative (-)	Negative at low T	Spontaneous at low T
Positive (+)	Positive (+)	Negative at high T	Spontaneous at high T

## भाग 2: रासायनिक साम्य (Chemical Equilibrium)

### 2.1 Equilibrium Constants

- ✓ Reversible reaction में आगे और पीछे की reaction की rates बराबर हो जाती हैं — Dynamic Equilibrium।

$$K_p = K_c(RT)^{\Delta n} \quad [\Delta n = \text{moles of gaseous products} - \text{moles of gaseous reactants}]$$

K Value	Meaning
$K \gg 1$ (very large)	Products favoured — Reaction nearly complete
$K \ll 1$ (very small)	Reactants favoured — Reaction barely proceeds
$K = 1$	Equal concentration of reactants and products at equilibrium

### 2.2 Le Chatelier's Principle

- ✓ Le Chatelier's Principle: जब equilibrium system पर stress (disturbance) डाला जाता है तो system उस stress को कम करने की दिशा में shift होती है।

Stress Applied	Equilibrium Shifts	Explanation
Concentration of reactant ↑	Forward →	More reactant = More product formed
Concentration of product ↑	Backward ←	Excess product consumed
Pressure ↑ (gas)	Toward fewer moles of gas	Fewer molecules = Lower pressure
Temperature ↑	Toward endothermic direction	System absorbs excess heat
Catalyst added	No shift (Rate increases both ways)	Equilibrium reached faster   K unchanged
Volume ↑ (gas)	Toward more moles of gas	Lower pressure compensated

**Industrial Application:** Haber Process ( $N_2+3H_2 \rightleftharpoons 2NH_3$ ): High P (200 atm), Low T (favours  $NH_3$ ) but Moderate T (450°C) for rate, Fe catalyst | Contact Process ( $SO_2+O_2 \rightarrow SO_3$ ):  $V_2O_5$  catalyst | Le Chatelier explains optimal conditions

## 2.3 Acids, Bases और pH

Theory	Acid	Base	Limitation
Arrhenius	$H^+$ in water	$OH^-$ in water	Only aqueous solutions
Bronsted-Lowry	$H^+$ donor (Proton donor)	$H^+$ acceptor (Proton acceptor)	Cannot explain Lewis acids without $H^+$
Lewis	Electron pair acceptor	Electron pair donor	Most general   Includes $BF_3$ , $AlCl_3$

$pH = -\log[H^+]$  [pOH =  $-\log[OH^-]$  |  $pH + pOH = 14$  (at 25°C) | Neutral: pH=7]

$K_w = [H^+][OH^-] = 10^{-14}$  at 25°C [Ionic product of water]

pH	Nature	$[H^+]$	Example
0	Very strongly acidic	1 mol/L	1M HCl
2	Strongly acidic	0.01 mol/L	Stomach acid (pH 1-2)
7	Neutral	$10^{-7}$ mol/L	Pure water at 25°C
7.35-7.45	Slightly alkaline	$\sim 4 \times 10^{-8}$ mol/L	Normal blood pH
9	Weakly alkaline	$10^{-9}$ mol/L	Baking soda
14	Very strongly alkaline	$10^{-14}$ mol/L	1M NaOH

**Body pH:** Blood: 7.35-7.45 | Stomach: 1.5-3.5 | Urine: 4.5-8.0 | Saliva: 6.5-7.5 | Acidosis: pH<7.35 | Alkalosis: pH>7.45 | pH change  $\pm 0.4$  = life-threatening

## भाग 3: विलयन (Solutions)

### 3.1 Colligative Properties

- ✓ Colligative Properties = Properties that depend on NUMBER of solute particles (not their nature). Four main colligative properties:

Colligative Property	Formula	Symbol	Application
Relative Lowering of Vapour Pressure	$(P^\circ - P)/P^\circ = \chi_{\text{solute}}$	RLVP	Raoult's Law
Elevation of Boiling Point	$\Delta T_b = K_b \times m$	$K_b$ (Ebullioscopic const)	Water: $K_b=0.52$ K·kg/mol
Depression of Freezing Point	$\Delta T_f = K_f \times m$	$K_f$ (Cryoscopic const)	Water: $K_f=1.86$ K·kg/mol   Antifreeze in cars
Osmotic Pressure	$\pi = MRT = CRT$	$\pi$ ( $P_i$ )	Medical: IV fluids, Dialysis, RO water purification

**Van't Hoff factor:  $i = \text{Observed/Expected}$**  [ $i > 1$ : Dissociation (electrolytes) |  $i < 1$ : Association (e.g., acetic acid in benzene)]

$\pi = iMRT$  [Osmotic pressure with Van't Hoff factor]

### 3.2 Osmosis — Clinical Importance

Solution Type	Osmolarity vs Blood	RBC Response	Clinical Use
Isotonic	Same (285-295 mOsm/L)	Normal (No change)	0.9% NaCl (NS), 5% Dextrose (D5W in practice)
Hypotonic	Less than blood	Cell swells → Lysis (Haemolysis)	0.45% NaCl — For hypertonic dehydration
Hypertonic	More than blood	Cell shrinks → Crenation	3% NaCl — Cerebral oedema, Hyponatraemia

**Dialysis Principle:** Dialysis works on principle of Osmosis + Diffusion | Semi-permeable membrane allows small molecules (urea, creatinine) to pass | Large molecules (proteins, blood cells) are retained | Used in Renal failure — Haemodialysis, Peritoneal dialysis

## भाग 4: विद्युत रसायन (Electrochemistry)

### 4.1 Electrochemical Cells

Cell Type	Energy Conversion	Reaction	Example
Galvanic/Voltaic Cell	Chemical → Electrical	Spontaneous redox	Daniel cell, Battery, Fuel cell
Electrolytic Cell	Electrical → Chemical	Non-spontaneous redox	Electroplating, Electrolysis, Na/Al extraction

### 4.2 Standard Electrode Potential और EMF

$E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}}$  [Reduction potential at cathode - Reduction potential at anode]

$\Delta G^\circ = -nFE^\circ_{\text{cell}}$  [n=electrons transferred | F=96500 C/mol (Faraday's constant)]

**Nernst Equation:  $E = E^\circ - (0.0592/n) \log Q$**  [At 25°C | Q=reaction quotient | E=EMF at non-standard]

Half-Reaction	$E^\circ$ (V)	Notes
$F_2 + 2e^- \rightarrow 2F^-$	+2.87	Strongest oxidising agent

$\text{MnO}_4^- + 8\text{H}^+ + 5\text{e}^- \rightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O}$	+1.51	$\text{KMnO}_4$ — purple oxidising agent
$\text{Cl}_2 + 2\text{e}^- \rightarrow 2\text{Cl}^-$	+1.36	Water purification, Bleaching
$\text{O}_2 + 4\text{H}^+ + 4\text{e}^- \rightarrow 2\text{H}_2\text{O}$	+1.23	Reduction of $\text{O}_2$
$\text{Fe}^{3+} + \text{e}^- \rightarrow \text{Fe}^{2+}$	+0.77	Iron redox — biological importance
$\text{Cu}^{2+} + 2\text{e}^- \rightarrow \text{Cu}$	+0.34	Copper electroplating
$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	0.00	Reference electrode (SHE)
$\text{Zn}^{2+} + 2\text{e}^- \rightarrow \text{Zn}$	-0.76	Zinc anode in Daniel cell
$\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$	-2.71	Strongest reducing agent (metal)
$\text{Li}^+ + \text{e}^- \rightarrow \text{Li}$	-3.05	Most negative — Strongest reducing agent

### 4.3 Conductance (चालकता)

**Conductance**  $G = 1/R$  | **Conductivity**  $\kappa = G \times l/A$  [Unit: S (Siemens) |  $l$ =length,  $A$ =area]

**Molar conductance**  $\Lambda_m = \kappa/C \times 1000$  [ $C$ =molarity | Unit:  $\text{S}\cdot\text{cm}^2/\text{mol}$ ]

Type of Electrolyte	$\Lambda_m$ behaviour with dilution	Examples	Kohlrausch's Law
Strong electrolyte	$\Lambda_m = \Lambda_m^\circ - bC^{1/2}$   Linear relationship	NaCl, HCl, NaOH	$\Lambda_m^\circ = \sum(\lambda^+ + \lambda^-)$
Weak electrolyte	$\Lambda_m$ increases rapidly near zero concentration	$\text{CH}_3\text{COOH}$ , $\text{NH}_4\text{OH}$	Cannot extrapolate to $\Lambda_m^\circ$

### 4.4 Faraday's Laws of Electrolysis

**1st Law:**  $m = ZQ = Zit$  [ $m$ =mass deposited |  $Z$ =electrochemical equivalent |  $I$ =current |  $t$ =time]

**2nd Law:**  $m \propto E$  (Equivalent Weight) [Same charge  $\rightarrow$  Mass  $\propto$  Equivalent weight |  $m_1/m_2 = E_1/E_2$ ]

Application	Process	Example
Electroplating	Metal deposition from solution	Ag, Ni, Cr, Au plating   Jewellery, Corrosion protection
Metal extraction	Electrolysis of molten ore	Al from Bauxite (Hall-Heroult), Na from NaCl (Down's cell)
Electrolysis of water	$2\text{H}_2\text{O} \rightarrow 2\text{H}_2 + \text{O}_2$	Hydrogen fuel production   $\text{H}_2$ at cathode, $\text{O}_2$ at anode
Medical applications	Iontophoresis	Drug delivery through skin using electrical current

**Battery Types:** Dry cell (Leclanché): Zn-MnO<sub>2</sub>, 1.5V, Non - rechargeable | Lead-Acid: Pb-PbO<sub>2</sub>, 2V/cell, Rechargeable (Car battery) | Li-ion: 3.7V, Rechargeable (Mobile, Laptop) | Fuel cell: H<sub>2</sub>+O<sub>2</sub>→H<sub>2</sub>O, Continuous operation

### BOOSTER POINTS — Paramedical Entrance Exam

1.  $\Delta G = \Delta H - T\Delta S$  |  $\Delta G < 0$ : Spontaneous |  $\Delta G = 0$ : Equilibrium |  $\Delta G > 0$ : Non-spontaneous
2. Hess's Law:  $\Delta H$  independent of path |  $\Delta H_{\text{rxn}} = \Sigma \Delta H_f(\text{products}) - \Sigma \Delta H_f(\text{reactants})$
3. Neutralisation enthalpy: Strong acid + Strong base = -57.1 kJ/eq | Weak acid/base = less exothermic
4. Le Chatelier: Pressure  $\uparrow \rightarrow$  shift to fewer moles | Temp  $\uparrow \rightarrow$  shift endothermic direction | Catalyst: No shift
5. Haber Process:  $\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$  | Fe catalyst, 450°C, 200 atm | Le Chatelier compromise conditions
6.  $\text{pH} = -\log[\text{H}^+]$  | Blood pH = 7.35-7.45 | Stomach pH = 1.5-3.5 | Acidosis  $< 7.35$  | Alkalosis  $> 7.45$
7.  $K_w = [\text{H}^+][\text{OH}^-] = 10^{-14}$  at 25°C |  $\text{pH} + \text{pOH} = 14$
8. Colligative properties depend on NUMBER not NATURE of particles: RLVP,  $\Delta T_b$ ,  $\Delta T_f$ , Osmotic pressure
9.  $\Delta T_f = K_f \times m$  | Water  $K_f = 1.86 \text{ K}\cdot\text{kg}/\text{mol}$  |  $\Delta T_b = K_b \times m$  | Water  $K_b = 0.52 \text{ K}\cdot\text{kg}/\text{mol}$
10. Van't Hoff factor  $i$ : NaCl  $\rightarrow i \approx 2$ , MgCl<sub>2</sub>  $\rightarrow i \approx 3$ , Glucose  $\rightarrow i = 1$
11. Isotonic: 0.9% NaCl,  $\sim 285 \text{ mOsm}$  | Hypotonic  $\rightarrow$  Cell swells | Hypertonic  $\rightarrow$  Cell shrinks
12.  $\pi = iMRT$  | Osmosis: Dialysis, Kidney filtration, Reverse osmosis water purification
13.  $E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}}$  | Positive = Spontaneous |  $\Delta G^\circ = -nFE^\circ$
14. Faraday's constant  $F = 96500 \text{ C}/\text{mol}$  | 1st Law:  $m = ZIt$  | 2nd Law:  $m_1/m_2 = E_1/E_2$
15. Strongest oxidising agent = F<sub>2</sub> (+2.87V) | Strongest reducing agent metal = Li (-3.05V)
16. At cathode: Reduction (gain e<sup>-</sup>) | At anode: Oxidation (lose e<sup>-</sup>) — BOTH electrochemical cells
17. Lead-acid battery: 2V/cell, 6 cells=12V (car) | Rechargeable | Pb(anode)+PbO<sub>2</sub>(cathode)+H<sub>2</sub>SO<sub>4</sub>

# Inorganic Chemistry

## अकार्बनिक रसायन

आवर्त सारणी | रासायनिक अभिक्रियाएँ | उपसहसंयोजक यौगिक | p-ब्लॉक | d-ब्लॉक

**Periodic Table | Chemical Reactions | Coordination**

**Compounds | p-block | d-block**

### भाग 1: आवर्त सारणी (Periodic Table)

#### 1.1 आवर्त सारणी का इतिहास

Scientist	Year	Contribution
Döbereiner	1829	Law of Triads — groups of 3 elements with similar properties
Newlands	1866	Law of Octaves — 8th element similar to 1st
Mendeleev	1869	Periodic Law: Properties are periodic functions of ATOMIC MASS   Predicted missing elements (Eka-silicon=Ge, Eka-boron=Ga)
Moseley	1913	Modern periodic law: Properties are periodic function of ATOMIC NUMBER

Modern Periodic Table: 118 elements | 7 Periods | 18 Groups | Based on ATOMIC NUMBER

#### 1.2 आवर्त सारणी की संरचना

Block	Elements	Filling Orbital	Groups
s-block	H, He, Alkali metals, Alkaline earths	s-orbital (1-2 e <sup>-</sup> )	1-2   Reactive, electropositive metals
p-block	Boron to Noble gases (B-Ne etc.)	p-orbital (1-6 e <sup>-</sup> )	13-18   Non-metals, Metalloids, Noble gases
d-block (Transition metals)	Sc to Zn, etc.	d-orbital	3-12   Coloured compounds, Variable valency
f-block (Inner transition)	Lanthanides (57-71) + Actinides (89-103)	f-orbital	Separate rows   Lanthanides: natural   Actinides: radioactive

### 1.3 Periodic Trends (आवर्ती प्रवृत्तियाँ)

Property	Along Period (→)	Down Group (↓)	Reason
Atomic radius	Decreases →	Increases ↓	More protons pull electrons   More shells added
Ionic radius	Cations < Atom < Anions	Increases ↓	Same trend as atomic radius
Ionisation energy	Increases →	Decreases ↓	Smaller atoms hold electrons tighter
Electron affinity	Increases → (generally)	Decreases ↓	Smaller atoms gain electrons more readily
Electronegativity	Increases → (F highest)	Decreases ↓	F = most electronegative (3.98)   Cs = least (0.79)
Metallic character	Decreases →	Increases ↓	Na > Mg > Al > Si > P > S > Cl (Period 3)

**Important Values:** Smallest atom: He | Largest atom: Cs | Highest IE: He | Lowest IE: Cs | Highest EN: F (3.98) | Lowest EN: Cs/Fr

### 1.4 Important Families of Elements

Group	Name	Elements	Key Properties
Group 1	Alkali Metals	H, Li, Na, K, Rb, Cs, Fr	1 valence e <sup>-</sup>   Highly reactive   React with water → H <sub>2</sub> + MOH
Group 2	Alkaline Earth Metals	Be, Mg, Ca, Sr, Ba, Ra	2 valence e <sup>-</sup>   Less reactive than Group 1   Ca = Bone formation
Group 17	Halogens	F, Cl, Br, I, At	7 valence e <sup>-</sup>   Highly electronegative   Strong oxidising agents
Group 18	Noble Gases	He, Ne, Ar, Kr, Xe, Rn	Full valence shell   Inert   He for balloons, Ne for signs
Groups 3-12	Transition Metals	Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn...	Variable valency, Coloured ions, Catalysts, Paramagnetic

## भाग 2: रासायनिक अभिक्रियाएँ (Chemical Reactions)

### 2.1 Types of Chemical Reactions

Reaction Type	Definition	General Form	Example
Combination (Synthesis)	Two or more → One product	A + B → AB	2H <sub>2</sub> + O <sub>2</sub> → 2H <sub>2</sub> O   CaO + CO <sub>2</sub> → CaCO <sub>3</sub>
Decomposition	One compound → Two or more	AB → A + B	2KClO <sub>3</sub> → 2KCl + 3O <sub>2</sub>   CaCO <sub>3</sub> → CaO + CO <sub>2</sub>

Single Displacement	More reactive displaces less reactive	$A + BC \rightarrow AC + B$	$Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$   $Fe + CuSO_4 \rightarrow FeSO_4 + Cu$
Double Displacement	Exchange of ions between two compounds	$AB + CD \rightarrow AD + CB$	$NaCl + AgNO_3 \rightarrow AgCl\downarrow + NaNO_3$
Redox (Oxidation-Reduction)	Transfer of electrons	—	$Fe + 2HCl \rightarrow FeCl_2 + H_2$   Combustion reactions
Precipitation	Insoluble product forms	—	$Pb(NO_3)_2 + 2KI \rightarrow PbI_2\downarrow + 2KNO_3$ (yellow ppt)
Acid-Base (Neutralisation)	$H^+ + OH^- \rightarrow H_2O$	—	$HCl + NaOH \rightarrow NaCl + H_2O$

## 2.2 Oxidation-Reduction (Redox) Reactions

Term	Old Definition	Modern Definition	Example
Oxidation	Addition of O / Loss of H	Loss of electrons (LEO)	$Fe \rightarrow Fe^{3+} + 3e^-$   $Zn \rightarrow Zn^{2+}$
Reduction	Removal of O / Gain of H	Gain of electrons (GER)	$Cu^{2+} + 2e^- \rightarrow Cu$   $H_2O \rightarrow H_2$

**OIL RIG:** OIL = Oxidation Is Loss (of electrons) | RIG = Reduction Is Gain (of electrons)  
 | Oxidising agent: Gets reduced (gains  $e^-$ ) | Reducing agent: Gets oxidised (loses  $e^-$ )

## 2.3 Oxidation States

Element/Rule	Oxidation State	Example
Free element	0	$Fe=0, O_2=0, Cl_2=0$
Monoatomic ion	Equals charge	+2 for $Ca^{2+}$ , -1 for $Cl^-$
O (Oxygen) in compounds	Usually -2 (except peroxide=-1, $OF_2=+2$ )	$H_2O: O=-2, H_2O_2: O=-1$
H (Hydrogen) in compounds	Usually +1 (except with metals=-1)	$HCl: H=+1, NaH: H=-1$
Sum of OS in compound	= 0	-
Sum of OS in ion	= charge of ion	$NO_3^-: N+3(-2)=-1 \rightarrow N=+5$
Mn in $KMnO_4$	$Mn=+7$	$K=+1, 4O=-8, Mn\ must=+7$
Cr in $K_2Cr_2O_7$	$Cr=+6$	Potassium dichromate
